INFORMATION IN THIS DOCUMENT IS PROVIDED IN CONNECTION WITH INTEL PRODUCTS. NO LICENSE, EXPRESS OR IMPLIED, BY ESTOPPEL OR OTHERWISE, TO ANY INTELLECTUAL PROPERTY RIGHTS IS GRANTED BY THIS DOCUMENT. EXCEPT AS PROVIDED IN INTEL'S TERMS AND CONDITIONS OF SALE FOR SUCH PRODUCTS, INTEL ASSUMES NO LIABILITY WHATSOEVER AND INTEL DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY, RELATING TO SALE AND/OR USE OF INTEL PRODUCTS INCLUDING LIABILITY OR WARRANTIES RELATING TO FITNESS FOR A PARTICULAR PURPOSE, MERCHANTABILITY, OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS OTHERWISE AGREED IN WRITING BY INTEL, THE INTEL PRODUCTS ARE NOT DESIGNED NOR INTENDED FOR ANY APPLICATION IN WHICH THE FAILURE OF THE INTEL PRODUCT COULD CREATE A SITUATION WHERE PERSONAL INJURY OR DEATH MAY OCCUR.

Intel may make changes to specifications and product descriptions at any time, without notice. Designers must not rely on the absence or characteristics of any features or instructions marked "reserved" or "undefined." Intel reserves these for future definition and shall have no responsibility whatsoever for conflicts or incompatibilities arising from future changes to them. The information here is subject to change without notice. Do not finalize a design with this information.

The products described in this document may contain design defects or errors known as errata which may cause the product to deviate from published specifications. Current characterized errata are available on request.

Contact your local Intel sales office or your distributor to obtain the latest specifications and before placing your product order.

All products, platforms, dates, and figures specified are preliminary based on current expectations, and are subject to change without notice. All dates specified are target dates, are provided for planning purposes only and are subject to change.

This document contains information on products in the design phase of development. Do not finalize a design with this information. Revised information will be published when the product is available. Verify with your local sales office that you have the latest datasheet before finalizing a design.

Intel® Active Management Technology requires activation and a system with a corporate network connection, an Intel® AMT-enabled chipset, network hardware and software. For notebooks, Intel AMT may be unavailable or limited over a host OS-based VPN, when connecting wirelessly, on battery power, sleeping, hibernating or powered off. Results dependent upon hardware, setup & configuration. For more information, visit <http://www.intel.com/technology/platform-technology/intel-amt>.

No system can provide absolute security under all conditions. Requires an enabled chipset, BIOS, firmware and software, and a subscription with a capable Service Provider. Consult your system manufacturer and Service Provider for availability and functionality. Intel assumes no liability for lost or stolen data and/or systems or any other damages resulting thereof. For more information, visit <http://www.intel.com/go/anti-theft>.

KVM Remote Control (Keyboard, Video, Mouse) is only available with Intel® Core™ i5 vPro and Core™ i7 vPro processors with Intel® Active Management technology activated and configured and with integrated graphics active. Discrete graphics are not supported.

Systems using Client Initiated Remote Access require wired LAN connectivity and may not be available in public hot spots or "click to accept" locations.

Warning: Altering clock frequency and/or voltage may (i) reduce system stability and useful life of the system and processor; (ii) cause the processor and other system components to fail; (iii) cause reductions in system performance; (iv) cause additional heat or other damage; and (v) affect system data integrity. Intel has not tested, and does not warrant, the operation of the processor beyond its specifications.

Code names featured are used internally within Intel to identify products that are in development and not yet publicly announced for release. Customers, licensees and other third parties are not authorized by Intel to use code names in advertising, promotion or marketing of any product or services and any such use of Intel's internal code names is at the sole risk of the user.

Intel, Intel® vPro™, and the Intel logo are trademarks of Intel Corporation in the U.S. and other countries.

*Other names and brands may be claimed as the property of others.

§ §

1 Introduction

This document covers the Intel® Management Engine Firmware (Intel® ME) 8.0 - 1.5MB SKU Firmware bring up procedure. Intel® ME is tied to essential platform functionality — this dependency cannot be avoided for engineering reasons.

The bring up procedure primarily involves building a Serial Peripheral Interface (SPI) Flash image that will contain:

- **[required]** Descriptor region — Contains sizing information for all other SPI Flash image regions, SPI settings (including Vendor Specific Configuration - or VSCC - tables, SPI device parameters), and region access permissions.
- **[required]** BIOS region — Contains firmware for the processor (or host) and/or Embedded Controller (EC).
- **[required]** Intel® ME FW region — Contains firmware for the Intel® Management Engine.
- **[optional]** GbE region — Contains firmware for Intel LAN solution.

For more details on SPI Flash layout, see the document **Intel® 8 Series/C220 series Chipset Family SPI Flash Programming Guide** and [Appendix A](#). Once the SPI Flash image is built, it will be programmed to the target Intel® 8 Series Chipset Family based platform and the platform will be booted. This document also covers any tests and checks required to ensure that this boot process is successful and that Intel® ME 1.5MB FW is operating as expected.

1.1 Related Documentation

CDI: Kit# 509296 - Intel® Ethernet Network Connections I217-LM - LAN Software Drivers -- LAN Access Division (LAD) - Version V10.0C00104 TIC: 272857. Alpha 2 Release providing support for our new Intel® Ethernet Connection I217-LM.

1.2 Intel® ME FW Features

This firmware release includes the following applications:

- Platform Clocks – Tune Intel® 8 Series Chipset Family clock silicon to the parameters of a specific board, configure clocks at run time, and power management clocks. **Benefit:** Allows extensive customizability and soft control of “Third generation” clock solution and makes clocks available before CPU powers up.
- Silicon Workaround Capability – Intel® ME FW will have limited capabilities to perform targeted workarounds for silicon issues. **Benefit:** Allows Intel® ME FW to address some issues that otherwise would require a new silicon stepping.

1.3 Prerequisites

Before this document is read and utilized, it is essential that the reader first review the 1.5MB FW Release Notes (included with this Intel® ME 1.5MB FW kit).

This document is constructed so that the reader can complete the bring up steps as given for the Intel Customer Reference Board (CRB). However, in the case that bring up is being performed on a different Intel® 8 Series Chipset Family based platform, this document will highlight any changes that must be imposed onto the bring up steps accordingly.

This document makes only the following limited assumptions regarding hardware:

- The platform is Intel® 8 Series Chipset Family based
- The platform is equipped with one or more SPI Flash devices with a total capacity sufficient for storing all relevant firmware images.

1.4 Acronyms and Definitions

1.4.1 General

Acronym or Term	Definition
API	Application Programming Interface
ASCII	American Standard Code for Information Interchange
BIOS	Basic Input Output System
CPU	Central Processing Unit
DIMM	Dual In-line Memory Module
DLL	Dynamic Link Library
DMI	Direct Media Interface
EC	Embedded Controller
EEPROM	Electrically Erasable Programmable Read Only Memory
FDI	Flexible Display Interface
FW	Firmware
GbE	Gigabit Ethernet
HECI	Host Embedded Controller Interface (aka Intel® MEI)
IBV	Independent BIOS Vendor
ID	Identification
Intel® ME	Intel® Management Engine (Intel® ME)
Intel® MEI	Intel® Management Engine Interface (Intel® MEI) (renamed from HECI)
Intel® IPT	Intel® Identity Protection Technology (Intel® IPT)
IMSS	Intel® Management and Security Status Application
ISV	Independent Software Vendor
JTAG	Joint Test Action Group
KVM	Keyboard, Video, Mouse
LAN	Local Area Network
LED	Light Emitting Diode

Acronym or Term	Definition
NVM	Non-Volatile Memory
NVRAM	Non-Volatile Random Access Memory
OOB	Out-of-Band
OS	Operating System
PAVP	Protected Audio and Video Path
PCI	Peripheral Component Interconnect
PCIe*	Peripheral Component Interconnect Express
PHY	Physical Layer (Networking)
PRTC	Protected Real Time Clock
RNG	Random Number Generator
RSA	RSA is a public key encryption method
RTC	Real Time Clock
SDK	Software Development Kit
SHA	Secure Hash Algorithm
SMBus	System Management Bus
SPI Flash	Serial Peripheral Interface Flash
TCP/IP	Transmission Control Protocol / Internet Protocol
TPM	Trusted Platform Module
UI	User Interface
UNS	User Notification Service
VSCC	Vendor Specific Configuration
WMI	Windows Management Instrumentation

1.4.2 Intel® Management Engine

Acronym or Term	Definition
3PDS	3rd Party Data Storage
Agent	Software that runs on a client PC with OS running
Intel® AT	Intel® Anti-Theft Technology (Intel® AT)
End User	The person who uses the computer (either Desktop or Mobile). In corporate, the user usually does not have an administrator privileges.
Host or Host CPU	The processor that is running the operating system. This is different than the management processor running the Intel® Management Engine Firmware.
Host Service/Application	An application that is running on the host CPU
INF	An information file (.inf) used by Microsoft* operating systems that supports the Plug & Play feature. When installing a driver, this file provides the OS the necessary information about driver filenames, driver components, and supported hardware.
Intel® Management Engine Interface (Intel® MEI)	Interface between the Management Engine and the Host system
Intel® MEI driver	Intel® ME host driver that runs on the host and interfaces between ISV Agents and the Intel® ME HW.
IT User	Information Technology User. Typically very technical and uses a management console to ensure multiple PCs on a network function.

Acronym or Term	Definition
LMS	Local Management Service: A SW application which runs on the host machine and provide a secured communication between the ISV agent and the Intel® Management Engine Firmware.
Intel® ME	Intel® Management Engine: The embedded processor residing in the chipset PCH
MECI	ME-VE Communication Interface
NVM	Non-Volatile Memory: A type of memory that will retain its contents even if power is removed.
OOB Interface	Out Of Band interface: This is SOAP/XML interface over secure or non-secure TCP protocol.
OS not Functional	The Host OS is considered non-functional in Sx power state and any one of the following cases when system is in S0 power state: <ul style="list-style-type: none"> • OS is hung • After PCI reset • OS watch dog expires • OS is not present
System States	Operating System power states such as S0. See detailed definitions in System States and Power Management section.
UIM	User Identifiable Mark

1.4.3 System States and Power Management

Acronym or Term	Definition
G3	A system state of Mechanical Off where all power is disconnected from the system. G3 power state does not necessarily indicate that RTC power is removed.
M0	Intel® Management Engine power state where all HW power planes are activated. The host power state is S0.
M3	Intel® Management Engine power state where all HW power planes are activated however the host power state is different than S0 (Some host power planes are not activated). Host PCIe* interface are unavailable to the host software. Main memory is not available for Intel® Management Engine use.
M-Off	No power is applied to the management processor subsystem. Intel® Management Engine is not operating.
OS Hibernate	System state where the OS state is saved on the hard drive.
S0	A system state where power is applied to all HW devices and the system is running normally.
S1, S2, S3	A system state where the host CPU is halted but power remains available to the memory system (memory is in self-refresh mode).
S4	A system state where the host CPU and memory are not active.
S5	A system state where all power to the host system is off, however the power cord (and/or battery in mobile designs) is still connected.
Shut Down	Equivalent to the S5 state.
Snooze Mode	Intel® Management Engine activities are mostly suspended to save power. The Intel® Management Engine monitors HW activities and can restore its activities depending on the HW event.
Standby	System state where the OS state is saved in memory and resumed from the memory when mouse/keyboard is clicked.
Sx	All S states which are different than S0.

1.5 Reference Documents

Document	Doc Number/ Location*
<i>Shark Bay Desktop and Denlow-WS Platform - Design Guide - Rev. 1.0</i>	486711 / IBL

Note: * Unless specified otherwise, a document can be ordered by providing its reference number to your Intel Field Applications Engineer.

1.6 Format and Notation

The formats and notations used within this document model are those typically used by BIOS vendors. This section describes the formatting and the notations that will be followed in this document.

Table 1-1. Number Format Notation

Number Format	Notation	Example
Decimal (default)	d	14d. Note that any number without an explicit suffix can be assumed to be decimal.
Binary	b	1110b
Hex	h	0Eh
Hex	0x	0x0E

Table 1-2. Data Format Notation

Data Type	Notation	Size
Bit	b	Smallest unit, 0 or 1
Byte	B	8 bits
Word	W	16 bits or 2 bytes
Double-word	DW	32 bits or 4 bytes
Quad-word	QW	8 bytes or 4 words
Kilobyte	KB	1024 bytes
Megabit	Mb	1,048,576 bits or 128 KB
Megabyte	MB	1,048,576 bytes or 1024 KB
Gigabit	Gb	1,073,741,824 bits
Gigabyte	GB	1024 MB

1.7 Kit Contents

The Intel® ME 1.5MB FW kit can be downloaded from VIP (<https://platformsw.intel.com/>). The contents of this kit are detailed below (Note that only key files are listed).

Table 1-3. Kit Contents (Sheet 1 of 3)

File or [Directory]	Content Description
[root]	Root directory
1.5MB FW Bring Up Guide.pdf	This document
1.5MB FW Getting Started Guide.pdf	This document provides an overview for using Intel® ME firmware.
Intel® 8 Series Chipset Family SPI Programming Guide.pdf	How to program SPI device parameters, VSCC tables, descriptor region details. Also contains a complete SPI Flash softstrap reference.
[Image Components]	
[BIOS]	
HSW_CRB_LPT_v80_01_Release.rom	BIOS image only for Intel CRB. This BIOS image works for both desktop and mobile CRBs. For other Intel® 8 Series Chipset Family based platforms, a custom BIOS image will be required.
[GbE]	
NAHUM6_CLARKSVILLE_DESKTOP_11.bin	Intel® LAN PHY firmware image. This image is for desktop platforms only.
NAHUM6_CLARKSVILLE_MOBILE_11.bin	Intel® LAN PHY firmware image. This image is for mobile platforms only.
[ME]	
ME9.0_1.5M_PreProduction.bin.bin	Intel® ME firmware image (Non Production FW) - supports unfused Intel® 8 Series Chipset Family PCH steppings: <ul style="list-style-type: none"> • Unfused LPT ES0 (Super SKU) Note: For PAVP Testing , you must match Production FW with Production Part and Non Production FW with Non Production Parts.
ME9.0_1.5M_Production.bin.bin	Intel® ME firmware image (Production FW) - supports fused and unfused Intel® 8 Series Chipset Family PCH steppings: <ul style="list-style-type: none"> • Unfused PPT ES0 (B0 Super SKU) • Fused PPT Pre-QS and QS Note: For PAVP Testing , you must match Production FW with Production Part and Non Production FW with Non Production Parts.
[Installers]	
Intel® ME SW Installation Guide.pdf	Intel® ME SW Installation Guide
[ME_SW]	
Setup.exe	Install executable (non-InstallShield) of Intel® ME Drivers for Windows* OS. See readme.txt for more information.
[ME_SW_IS]	
ME_SW_IS.zip	Zip containing InstallShield* files of Intel® ME Drivers for Windows* OS. See readme.txt in previous directory for more information.

1.8 External Hardware Requirements for Bring Up

Acquire the following hardware tools before moving on to the next step.

Windows* OS System	Flash Burner	DOS Bootable USB Key
		
<p>Equipment:</p> <ul style="list-style-type: none"> Laptop or desktop that supports win32 applications <p>Purpose:</p> <ul style="list-style-type: none"> Will run firmware image assembly and build process software. 	<p>Equipment:</p> <ul style="list-style-type: none"> (Optional) For platforms that don't boot, a Flash Chip Programmer will be required For platforms that can boot to DOS or Windows*, a Flash Programming Tool (FPT) is provided in this kit <p>Purpose:</p> <ul style="list-style-type: none"> Will burn firmware images onto the target system Flash device(s). 	<p>Equipment:</p> <ul style="list-style-type: none"> A DOS Bootable USB Key (Size > 512 MB) <p>Purpose:</p> <ul style="list-style-type: none"> Acting as a bootable device and will be used to run Flash Programming Tool (fpt.exe) directly on the system that is undergoing Bring Up process. Or will be used to transfer a firmware image onto a Flash burner.

§ §

2 Image Creation: Flash Image Tool (FITC)

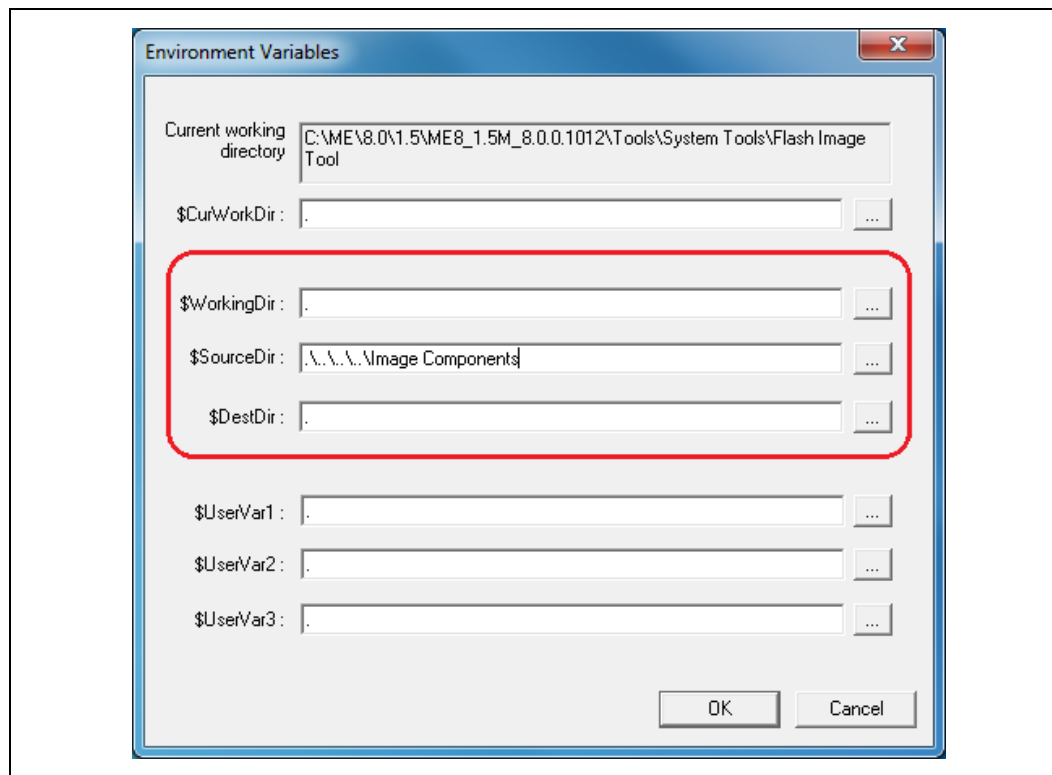

Flash Image Tool (FITC) will be used to generate a full SPI Flash binary image with Descriptor, GbE, BIOS, and Intel® ME Regions. Use the steps shown in following sections.

Note: The FITC Tool may be updated throughout the release cycles. As a general rule, please ensure you use the tools, images and other content from the same kit and refrain from using different version tools.

After this SPI Flash image is created, it will need to be burned onto the target platform's SPI Flash device(s). [Section 3, "Programming SPI Flash Devices and Checking Firmware Status"](#) later in this document provides steps to do this.

2.1 Start FITC and Set Up The Build Environment

1. Invoke Flash Image Tool. Using Explorer*, navigate to **[root]\Tools\System Tools\Flash Image Tool**. Ensure that FITC's directory contents are intact (see [Section 1.7](#)). Double-click **fitc.exe**.
2. In the main menu select **Build | Environment Variables....** Edit your configuration as shown below. Note that in the example, **[root]\Tools\System Tools\Flash Image Tool** is **\"**.
 - Keep the Working Directory \$WorkingDir as **\"**.
 - Source Directory \$SourceDir is where FITC will look to find binary images during the image creation process, change \$SourceDir to **\"**.
 - Destination Directory \$DestDir is where FITC will save the SPI Flash binary image, keep \$DestDir as **\"**.

Figure 2-1. Build | Environment Variables

3. Click **OK** to apply your changes.

4. In the main menu select **Build | Build Settings....** Leave the defaults for **Output path**, **Generate intermediate build files**, and **Build compact image** as shown. Change the **Flash Block/Sector Erase Size** as appropriate for your SPI flash part(s). Click **OK** to apply your changes.

Figure 2-2. Build | Build Settings...

5. In the main menu select **File | Open....** In the Open dialog that appears navigate to **[root]\Tools\System Tools\Flash Image Tool**. Click on **newfiletmpl.xml** and click **OK**.

2.2 Configure PCH Silicon Stepping

Leave the **PCH Silicon Stepping Combo Box** at its default value of **Intel® 8 Series Chipset**.

Figure 2-3. PCH Silicon Stepping Combo Box

2.3 Set Up SPI Flash Regions

Table 2-1. Flash Image | PDR Region

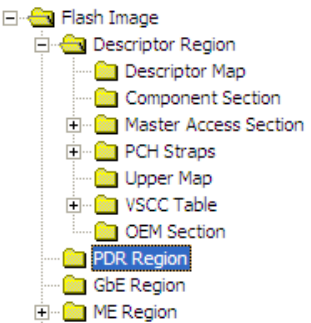

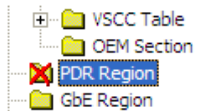

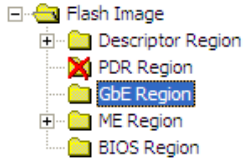

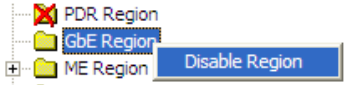

Location	Parameter	CRB Set To	Settings for Any Platform
Follow navigation tree below: <ul style="list-style-type: none"> Select the Flash Image Select Flash Image PDR Region Set the parameters in the PDR Region section as shown 	PDR Region Length	PDR Region is disabled	Displays Region size information when Binary input file is specified.
	Binary Input File	PDR Region is disabled	Load a Platform Data Region binary if required and available.
...or if NOT using Platform Data Region (PDR)			
A red "X" will indicate whether this Region is disabled. If this Region is not disabled, disable it by right-clicking on Flash Image PDR Region and selecting Disable Region .			

Table 2-2. Flash Image | GbE Region

Follow navigation tree below: <ul style="list-style-type: none"> Select the Flash Image Select Flash Image GbE Region Set the parameters in the GbE Region section as shown 	Yellow means custom settings may be required.		
	GbE LAN region length	0x00000000	
	Binary input file	Navigate to your Source Directory (as specified in Section 2.1) and switch to the GbE subdirectory. Choose the appropriate Intel GbE LAN Firmware binary image. If not using Intel LAN then leave this parameter blank.	
	Intel® Integrated LAN Enable	true	This field only is editable after an Intel integrated LAN image is loaded. If not planning to validate Intel LAN on target platform, or for debug reasons, set to false .
	Major Version	0	Displays major revision value for Intel LAN GbE FW version when Binary input file is specified.
	Minor Version	0	Displays minor revision value for Intel LAN GbE FW version when Binary input file is specified.
	Image ID	0	Displays image ID value for Intel LAN GbE FW version when Binary input file is specified.
...or if not using Intel wired LAN device			
A red "X" will indicate whether this Region is disabled. If this Region is not disabled, disable it by right-clicking on Flash Image GbE Region and selecting Disable Region .			

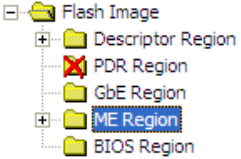

Table 2-3. Flash Image | ME Region

Location	Parameter	CRB Set To	Settings for Any Platform
<p>Follow navigation tree below:</p> <ul style="list-style-type: none"> Select the Flash Image tab Select Flash Image ME Region Set the parameters in the ME Region section as shown Note: Loading an ME FW binary image that contains ME ROM Bypass unlocks the ME Boot from Flash parameter in Flash Image Descriptor Region PCH Straps PCH Strap 10 	Yellow means custom settings may be required, otherwise use CRB setting.		
	Binary input file	Navigate to your Source Directory (as specified in Section 2.1) and switch to the Firmware subdirectory. Choose the Intel® ME FW binary image. Note: You may choose to build the Intel® ME Region only. To do so, Flash Image Descriptor Region Descriptor Map parameter Number of Flash components must be set to 0 . Note: Loading an Intel® ME FW binary image that contains ME ROM Bypass unlocks the ME Boot from Flash parameter in Flash Image Descriptor Region PCH Straps PCH Strap 10 .	
	WCOD Id	0x0082 TAYLOR	Determines which WLAN micro code will be supported in the firmware image
	LOCL Id	0x01 EN	Determines which localized language data will be used by firmware for secure output screens (Examples: SOL / KVM)
	* Partition Rom Bypass Enabled		Not a parameter. This information panel appears when an ME FW image enables ME boot directly from Flash.
	Major Version	0	Displays major revision value for ME FW version when Binary input file is specified.
	Minor Version	0	Displays minor revision value for ME FW version when Binary input file is specified.
	Hotfix Version	0	Displays hotfix value for ME FW version when Binary input file is specified.
	Build Version	0	Displays build value for ME FW version when Binary input file is specified.
<p>Note: Starting with Intel® ME 8.0, the FW image provided in the kits includes additional code partitions which are used by both full and partial FW update mechanisms as a result of these changes the image is larger than FW images from previous generations. In addition to this change the FW image in the kits will be used for generating full image binaries using FITc and full or partial FW updates using FWUpdIcI.</p> <p>Customers will not be able to write the image provided in the kits directly to flash. The image must be loaded into FITc tool then built in order to create a working ME region.</p>			

**Table 2-4. Flash Image | BIOS Region**

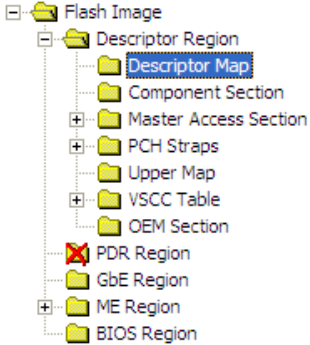

Location	Parameter	CRB Set To	Settings for Any Platform
Follow navigation tree below: <ul style="list-style-type: none"> Select the Flash Image tab Select Flash Image BIOS Region Set the parameters in the BIOS Region section as shown 	Yellow means custom settings may be required, otherwise use CRB setting.		
	BIOS region length	0x00000000	This field allows user to allocate a specific size in the SPI Flash for the BIOS image. If set to 0, FITC will automatically set the size based on the BIOS image.
	Binary input file	For the Intel CRB navigate to your Source Directory (as specified in Section 2.1) and switch to the BIOS subdirectory. Choose the BIOS binary image.	For all other platforms point this parameter to the appropriate BIOS image. If BIOS is stored in a separate SPI Flash device or in FWH (see Configurations "B", "C", and "D" in Appendix A) then leave this parameter blank.

2.4 Set Up Descriptor and SPI Flash Device(s)

Table 2-5. Flash Image | Descriptor Region

<p>Follow navigation tree below:</p> <ul style="list-style-type: none"> Select the Flash Image tab Select Flash Image Descriptor Region Descriptor Map Set the parameters in the Descriptor Map section as shown 	Yellow means custom settings may be required, otherwise use CRB setting.		
	Region base address	0x04	Read Only, See SPI programming Guide for details.
	Number of Flash components	2	Number of SPI Flash devices on the platform 1 or 2 = Total SPI Flash devices 0 = Build ME region only
	Component base address	0x03	Read Only, See SPI programming Guide for details.
	Number of PCH straps	20	Read Only, See SPI programming Guide for details.
	PCH straps base address	0x10	Read Only, See SPI programming Guide for details.
	Number of Masters	2	Read Only, See SPI programming Guide for details.
	Master base address	0x06	Read Only, See SPI programming Guide for details.
	Number of PROC straps	1	Read Only, See SPI programming Guide for details.
	PROC straps base address	0x20	Read Only, See SPI programming Guide for details.

Table 2-7. Flash Image | Descriptor Region | Component Section

Location	Parameter	CRB Set To	Settings for Any Platform
<p>Follow navigation tree below:</p> <ul style="list-style-type: none"> Select the Flash Image tab. Select Flash Image Descriptor Region Component Section Set the parameters in the Component Section section as shown 	Yellow means custom settings may be required, otherwise use CRB setting.		
	Read ID and Read Status clock frequency	50MHz	Lowest common frequency of all SPI Flash parts on the platform.
	Write and erase clock frequency	50MHz	Lowest common frequency of all SPI Flash parts on the platform.
	Fast read clock frequency	50MHz	In order for PCH HW to override its own internal default value (20 MHz), Fast read support must be set To true .
	Fast read support	true	true = Enables opcode 0Bh opcode on a read. This allows for faster read frequencies on serial flash by having a single dummy byte before valid data is output from the flash.
	Read clock frequency	20MHz	
	Flash component 2 density	8MB	Size of second SPI Flash part on the platform. Note: This value will be grayed out if the number of SPI Flash components is set to 1 in the Descriptor Map options.
	Flash component 1 density	8MB	Size of first SPI Flash part on the platform.
	Dual Output Fast Read Support	true	This field enables the opcode 3Bh to use Single Input Dual Output Fast Read. This speeds up the fast read throughput of the serial flash part. Note: This should only be set to 'true' if all Serial Flash parts support the 3Bh command. See <i>LPT SPI programming Guide</i> for more details.
	Invalid instruction 3	0	Opcode entered here will not be allowed by the PCH's SPI controller for HW sequencing. See <i>LPT SPI programming Guide</i> for more details. 0 = no instruction is specified
	Invalid instruction 2	0	
	Invalid instruction 1	0	
	Invalid instruction 0	0	
	Invalid instruction 7	0	
	Invalid instruction 6	0	
	Invalid instruction 5	0

	PCIe Power Stable Timer Enable	t205b timer is disabled	This strap controls the behavior of the t205b timer. t205b timer is disabled PCH will count 99ms from PWROK assertion before PLTRST# is de-asserted Note: See Intel® 8 Series/C220 series Chipset Family EDS for details
	SLP_LAN#/GPIO29 Select	false	true = Enables GPIO29 and disables SLP_LAN# functionality. false = Set to false to use have GPIO behave as SLP_LAN#. Note: This field is read only if Intel integrated LAN is disabled. See Table 2-2.
	t1001 Timing	1 ms	This setting controls t1001 timing from CPUWRGD assertion to SUS_STAT#. 1ms (default) 30us 5ms 2ms Note: See Intel® 8 Series/C220 series Chipset Family EDS for details
	t573 Timing	1ms	This setting controls minimum t573 timing from XCK_PLL locked to CPUWRGD. 100 ms (default) 50 ms 5 ms 1 ms Note: See Intel® 8 Series/C220 series Chipset Family EDS for details
	Intel® Integrated LAN Enable	true	Treat as reserved.
	Deep Sx Platform	false	Treat as reserved.

Table 2-23. Flash Image | Descriptor Region | PCH Straps | PCH Strap 17

Location	Parameter	CRB Set To	Settings for Any Platform
Yellow means custom settings may be required.			
<p>Follow navigation tree below:</p> <ul style="list-style-type: none"> Select Flash Image Descriptor Region PCH Straps PCH Strap 17 Set the parameters in the PCH Strap 17 section as shown 	BTM/FCIM Select	Full Clock Integrated Mode	<p>If PCH clock boot mode is specified by soft strap then this parameter specifies whether the PCH clocks boot in Full Clock Integrated Mode (FCIM) or Buffer Through Mode (BTM).</p> <p>NOTE: Buffer Through Mode (BTM) is NOT POR mode supported by Intel® 8 Series Chipset Family and it will not be validated by Intel.</p>

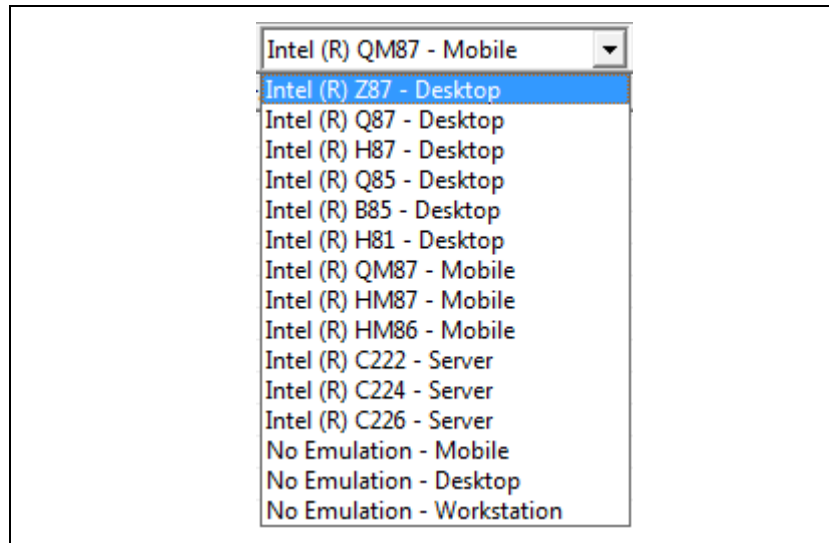

2.5 Configure PCH Silicon SKU

Use the **SKU Manager Combo Box** to select the appropriate platform type for your specific chipset.

For Intel® ME 1.5MB FW, the only valid choices are:

- Intel® 8 Series Chipset family
 - Intel® Z87 Express Chipset
 - Intel® Z85 Express Chipset
 - Intel® H87 Express Chipset
 - Intel® H81 Express Chipset
 - Mobile Intel® HM87 Express Chipset
 - Mobile Intel® HM86 Express Chipset

Figure 2-4. SKU Manager Combo Box

When a PCH SKU is selected in FITC, Super SKU PCH silicon will then behave as if it were the selected Production SKU PCH silicon from Intel®ME FW perspective. The SKU Manager selection option has no effect on Production SKU PCH silicon. Features cannot be enabled on such SKUs that do not support them.

Note: The SKU Manager combination box changes the LPC device ID which is used to identify the PCH. If there are issues with drivers, host software, or BIOS that do not recognize the PCH, then select the appropriate SKU with Super SKU DID.

Note: P67 must use a discrete graphics solution. Undesired behavior such as failure to boot may result if using integrated graphics.

Note: For more information see [Section 4.1](#) for Intel®ME FW features listed by Production SKU PCH silicon.

Note: Sections of FITC other than the **Features Supported** folder under **Flash Image ME|Region| Configuration** will not reflect what is disabled for the selected PCH silicon SKU and/or ME FW binary.

2.6 Intel®ME FW Feature Configuration

Note: Do not load or change any parameters in the Configuration tab until you load an Intel®ME Region binary (see [Table 2-3](#)).

2.6.1 Firmware Features and Capabilities

Table 2-24. Flash Image | ME Region | Configuration | ME (Sheet 1 of 2)

Location	Parameter	CRB Set To	Settings for Any Platform
<p>Follow navigation tree below:</p> <ul style="list-style-type: none"> Select Flash Image ME Region Configuration ME Set the parameters in the ME section as shown 	Yellow means custom settings may be required.		
	FW Update OEM ID	00000000-0000-0000-0000-000000000000	This field provides the ability to target FWUpdate (FWUpdLcl.exe) by Platform OEM. This ID will make sure that customers can only update a platform with an image coming from the platform OEM. If set to an all zeros, then any input is valid when doing a firmware update.
	LAN Power Well Config	3	Intel LAN power configuration selection: 0 = Core Well (SLP_S3#) 1 = Sus Well (RSMRST#) 2 = ME Well (SLP_M#) 3 (recommended) = SLP_LAN#
	WLAN Power Well Config	0x86	0x80 = Disabled 0x82 = Sus Well 0x83 = ME Well 0x86 = WLAN Sleep via SLP_WLAN# (default)
	M3 Power Rails Availability	true	true = M3 power rails designed on platform (ME is powered by standby) false = M3 power rails not designed on platform (ME is powered by core) Note: This field is read only if Power package 2 supported is enabled. Note: Please consult the target hardware designer to determine this setting.
	Host ME Region Flash Protection Override	true	false = Disable HMFPRO LOCK and HMFPRO ENABLE Intel® MEI messages for BIOS-based FW Update true = Enable this capability Note: Please consult the target BIOS developer to determine this setting.

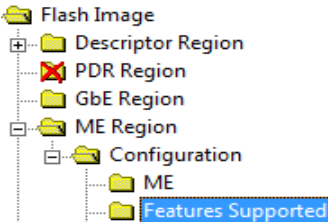

Table 2-24. Flash Image | ME Region | Configuration | ME (Sheet 2 of 2)

Location	Parameter	CRB Set To	Settings for Any Platform
	PROC_MISSING	No onboard glue logic	Only set if there is glue logic present on the board to enable if the processor is missing. Note: This field is read only if a Mobile SKU is selected in the SKU Manager pull down box. Note: Please consult the target hardware designer to determine this setting.
	Processor Emulation	No Emulation	Set this parameter to the type of processor that the target system will use during production. This field will emulate that processor class for pre-production silicon.
	OEM Tag	0x00000000	This value allows OEMs to set a unique number value in their firmware images to allow for easier identification.
	Hide FW Update Control	false	This option determines if the MEBx FW Update is visible or hidden from end users. 'false' - The MEBx FW update option will be visible to end users. 'true' - The MEBx FW update option will not be visible to the end user.
	Debug Si Features	0x00000000	Allows OEM Control to enable FW features to assist with the debug of the platform. This control has no effect if used on production silicon. Bit 0: Disable DRAM_INIT_DONE timeout Bit 1: Disable FW WDT (when descriptor is unlocked) Bit 2: Disable CPU_RESET_DONE timeout Bit 3: Override power package to always enter M3
	Prod Si Features	0x00000000	Allow OEM Control to enable FW features to assist with the production platform. Bit 0: Extend DRAM_INIT_DONE timeout to 30 minutes Bit 1: Disable FW WDT (when descriptor is unlocked) Bit 2: Disable CPU_RESET_DONE timeout Bit 3: Override power package to always enter M3
	M3 Autotest Enabled	false	This enables Intel® ME FW M3 auto test during platform early boot. 'false' - The Intel® ME FW will not run M3 tests during first boot after platform image flash. 'true' - The Intel® ME FW will run M3 tests during first boot after platform image flash.
	Enable hash file creation	true	This enables the creation of an external hash file of the ME Region.
	Independent Firmware Recovery Enable	true	This option determines if Independent Firmware Recovery is enabled. 'false' - Independent Firmware Recovery is disabled in the firmware. 'true' - Independent Firmware Recovery is enabled in the firmware.

Table 2-25. Flash Image | ME Region | Configuration | Features Supported

Location	Parameter	CRB Set To	Settings for Any Platform
Follow navigation tree below: <ul style="list-style-type: none"> Select Flash Image ME Region Configuration Features Supported Set the parameters in the Features Supported section as shown 	Yellow means custom settings may be required.		
	Enable Intel® Standard Manageability; Disable Intel® AMT	Yes	Note: Setting any of these options to 'Yes' will permanently disable that specific feature. Once the feature is disabled in this manner only re-Flashing the ME region can re-enable the feature. Fields are read only if the feature is not supported by respective PCH SKU selected by PCH SKU pull down (see Section 2.8).
	Intel® Manageability Application Permanently Disabled?	Yes	
	PAVP Permanently Disabled	No	
	KVM Permanently Disabled?	Yes	
	TLS Permanently Disabled?	No	
	Intel® Anti-Theft Technology Permanently disabled	No	
	Intel® ME Network Service Permanently disabled	No	
	Service Advertisement and Discovery Permanently disabled ¹	No	
	Intel® Manageability Application Enable/Disable	Disabled	Disabled (not supported on 1.5MB FW)
Note: The Feature supported settings shown above are an example. Refer to Appendix 4.1 for information on specific SKU related settings.			

Notes:

- Services Advertisement & Discovery was previously referred to as mDNS.

Since 1.5MB FW does not support “Manageability Application” the following settings **Flash Image | ME Region | Configuration | Manageability Application**, are not applicable.

Table 2-26. Flash Image | ME Region | Configuration | Manageability Application

2.7 Build SPI Flash Binary Image

2.7.1 Build SPI Flash Binary Image

In the main menu select **Build | Build Image**. The image will be saved in the directory specified by **\$DestDir** parameter and will be named **outimage.bin**, unless the default **Output Directory** in **Build | Build Settings** was changed (see [Section 2.1](#)).

Figure 2-5. Build | Build Image

2.7.2 Save Your Settings

In the main menu select **File | Save As....** Select a name and location for the XML file that contains all the settings configured thus far. It is recommended that you save this file in your **[root)]\Tools\System Tools\Flash Image Tool** directory for easy access.

Assuming that the custom settings file was saved as **customfile.xml** to the FITC directory (**[root]]\Tools\System Tools\Flash Image Tool**), then these settings could be loaded in the FITC GUI itself using the main menu option **File | Load....**

Note: Previous platform generations of the FITC tool required multiple configuration files to be edited and saved. For this generation, only one configuration file (**customfile.xml**) is required.

This custom settings file could also be used to generate an SPI Flash binary image using the command line, with a command of the form:

```
fitc.exe [xml_file] [/o <file>] /b
```

Example usage: > fitc.exe newfiletmpl.xml /o .\temp.bin /b

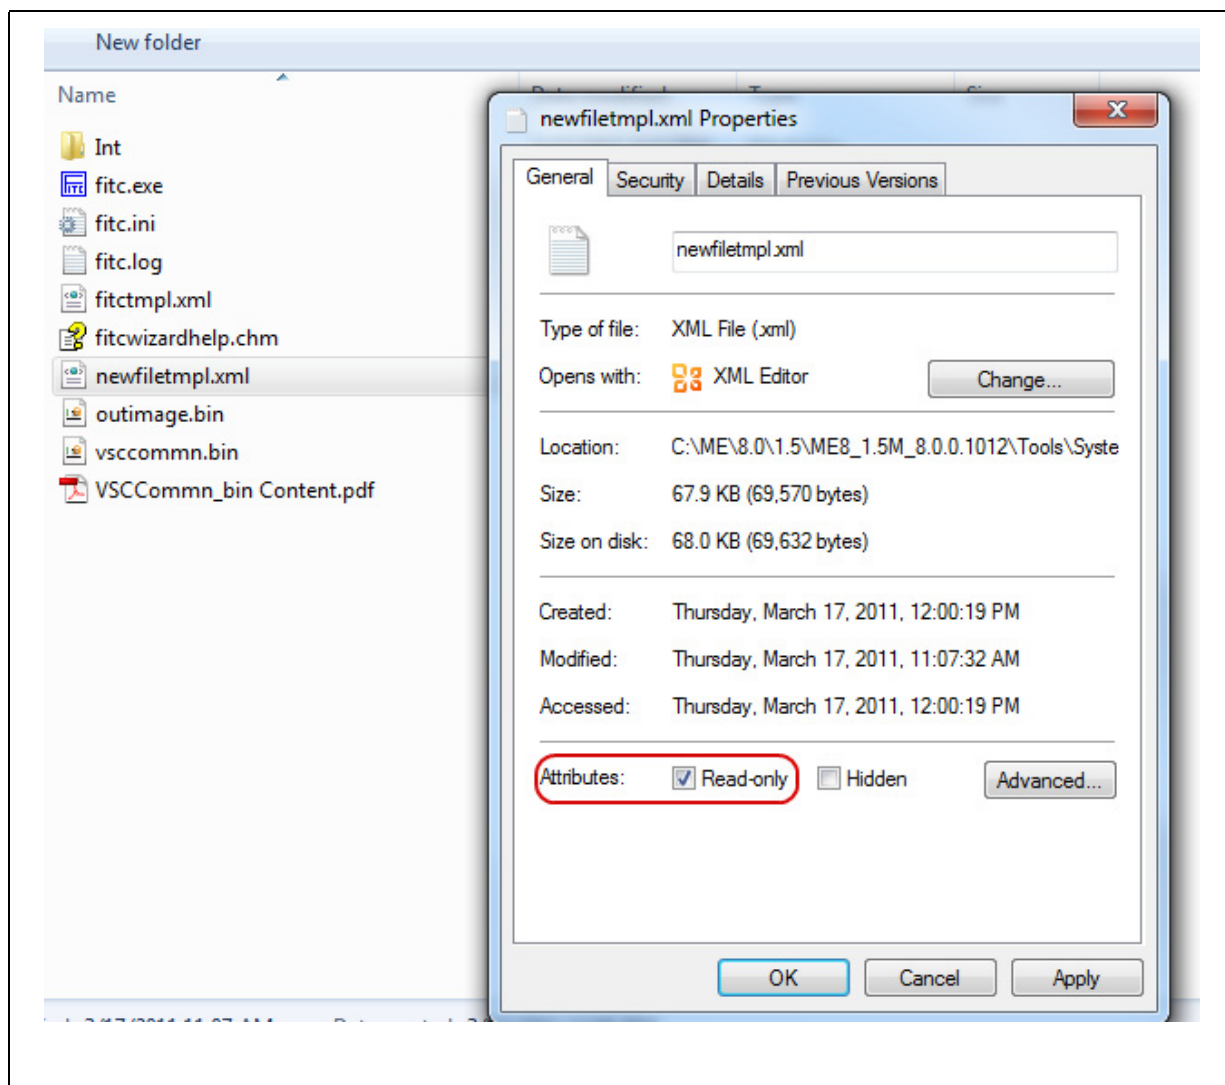

where:

- **<xml_file>** — The XML configuration file saved when configuring FITC.
- **/o <file>** — The path and filename where the image will be saved. This command overrides the 'Output path' in the XML file.
- **/b** — Automatically builds the Flash image. The FIT GUI will not be displayed when this flag is set, since FIT will run in auto-build mode. Error messages will be displayed by FITC, if necessary.

2.7.3 Protect Saved Configuration XML File

To avoid custom-configured values from ever overwritten when loading new binaries files (ie: when loading binaries into BIOS, GbE and ME regions in FITC) do the following (see [Figure 2-6](#)):

- After building the SPI Flash binary image and saving your configuration, close Flash Image Tool
- Right-click on the saved FITC configuration XML file (**customfile.xml**) and select **Properties**
- Check the **Read-Only** checkbox and click **OK**

Figure 2-6. Protecting FITC Configuration XML File**§ §**

3 Programming SPI Flash Devices and Checking Firmware Status

Now that the Flash image file has been created, it can be programmed into the SPI Flash device(s) of the target machine. For platforms that don't boot, a Flash Chip Programmer will be required. For platforms that can boot to DOS or Windows*, the Flash Programming Tool (FPT) can be used.

3.1 Flash Burner/Programmer

The specific use of a Flash burner/programmer is beyond the scope of this document. However, the following general steps may be followed:

1. Navigate to your **Output Directory** (as specified in [Section 2.1](#)) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**.

If two total SPI Flash devices were specified during the build process, then additional image files will be saved, one for each SPI Flash device. These files are assumed to be named **outimage(1).bin** and **outimage(2).bin**.

2. Utilize a Flash burner/programmer to program the image(s). For multiple SPI Flash devices, the images are numbered sequentially to correspond to the first and second SPI Flash device accordingly.

3.1.1 In-Circuit SPI Flash Programming for Mobile CRB

Mobile CRBs have the SPI Flash devices soldered down. As a result, to program the SPI Flash for mobile CRBs, follow these steps:

1. Leave mobile CRB powered off.
2. Connect Flash Programmer (such as DediProg SF100) header to connector **J8E1** which is labelled "**SPI PROG**". Make sure to line up pin 1 on the header.
3. Change the jumpers to the "**Programming SPI-0**" mode as shown in [Table 3-1](#) below.

Table 3-1. Jumper Settings for Mobile CRB SPI Flash Programming

Mode	J8C4	J8C5	J8D1
Programming SPI-0	1-2	1-2	1-2
Programming SPI-1	1-2	1-2	2-3
Normal Operation	1-X	1-X	1-X

4. Program the first image [outimage(1).bin] to the CRB.
5. Following [Table 3-1](#), change the jumpers to the "**Programming SPI-1**" mode.
6. Program the second image [outimage(2).bin] to the CRB.
7. Once programming is complete, disconnect the Flash Programmer header. The CRB is now ready for power on.

3.2 Flash Programming Tool (FPT)

FPT can be used to substitute for a Flash burner/programmer, provided the system is capable of booting to a DOS or Windows* OS.

Note: FPT will automatically disable the Intel® ME prior to flashing the image to the platform.

FPT DOS Version

The DOS versions supported by FPT are: DOS, Free DOS, and DRMK DOS. Use the following steps to program the SPI Flash devices,

1. Copy all the files in the “(root)\Tools\System Tools\Flash Programming Tool\DOS” directory to the root directory of a bootable USB key.
2. Navigate to your **Output Directory** (as specified in [Section 2.1](#)) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**. Copy this image file to the root directory of the USB key.
3. Boot the target system to DOS and change to the root directory of the bootable USB key. At the DOS prompt type:

```
fpt.exe /i
```

The system should respond with the number of SPI Flash devices available. For example:

```
--- Flash Devices Found ---  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)  
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
```

Note: If the SPI Flash device does not currently contain a descriptor it may report only a single device.

4. Program the SPI Flash image to the Flash device(s) by issuing the following command at the prompt:

```
fpt.exe /f outimage.bin
```

If the programming was successful, then the following message will be shown.

```
FPT Operation Passed
```

If the programming was **NOT** successful, then repeat this step to try again. If programming problems persist, then check the SPI Flash devices and platform hardware.

5. Execute a platform global reset using FPT -greset. Next go to [Section 3.3](#) to check the Intel® ME Firmware status.

3.2.1 FPT Windows* Version

The Windows* OS versions supported by FPT are: Windows* PE, Windows* XP SP2, Windows* Vista and Windows* 7. There are two versions of FPT for Windows*: a 32-bit version and a 64-bit version. Most Windows* OS, Windows* XP, Vista and Windows* 7 (32-bit or 64-bit) can use Windows* version of FPT. However, Windows* OS which do not support 32 bit compatible mode (Win PE 64-bit) **must use** FPT Windows* 64-bit version due to compatibility issues.

Use the following steps to program the SPI Flash devices,

1. Navigate to your **Output Directory** (as specified in [Section 2.1](#)) where your generated SPI Flash image(s) are saved. It is assumed that this image file is named **outimage.bin**. Copy this image file to FPT directory located at "(root)\Tools\System Tools\Flash Programming Tool\Windows".
2. Boot the target system to Windows* and open a Command Prompt window. In this window, change to the FPT directory and at the prompt type:

```
fptw.exe /i
```

The system should respond with the number of SPI Flash devices available. For example:

```
--- Flash Devices Found ---
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
W25Q64BV ID:0xEF4017 Size: 8192KB (65536Kb)
```

Note: If the SPI Flash device does not currently contain a descriptor it may report only a single device.

3. Program the SPI Flash image to the Flash device(s) by issuing the following command at the prompt:

```
fptw.exe /f outimage.bin
```

If the programming was successful, then the following message will be shown.

```
FPT Operation Passed
```

If the programming was **NOT** successful, then repeat this step to try again. If programming problems persist, then check the SPI Flash devices and platform hardware.

4. Power down the platform with a G3 power cycle (ensure all power is disconnected from the system). Next go to [Section 3.3](#) to check the Intel® ME Firmware status.

3.3 Checking Intel® ME Firmware Status

Use the following steps to check the platform health and Intel® ME FW status,

1. Copy the file **MEInfo.exe** in the "(root)\Tools\System Tools\MEInfo\DOS" directory to the root directory of a bootable USB key.

2. Boot the target system and stop at the BIOS setup menu. Load default values for BIOS (on Intel® CRBs press F3 to load default values). Save and reboot (on Intel® CRBs press F4 and select Yes).
3. Boot the target system to DOS and change to the root directory of the bootable USB key. At the DOS prompt type:

```
MEInfo.exe
```

The system should respond with a message similar to below.

```
Intel(R) MEInfo Version: 9.0.0.xxxx
Copyright(C) 2005 - 2011, Intel Corporation. All rights reserved.

Intel(R) Manageability and Security Application code versions:

BIOS Version:                ACRVMBY1.86C.0035.B00.1103131018
MEBx Version:                9.0.0.xx
Gbe Version:                 1.3
VendorID:                    8086
PCH Version:                 600000
FW Version:                  9.0.0.xxxx

FW Capabilities:             0x0DFE5C67

    Intel(R) Active Management Technology - PRESENT/ENABLED
    Intel(R) Anti-Theft Technology - PRESENT/ENABLED
    Intel(R) Capability Licensing Service - PRESENT/ENABLED
    Protect Audio Video Path - PRESENT/ENABLED
    Intel(R) ME Dynamic Application Loader - PRESENT/ENABLED

Intel(R) AMT State:          Enabled
CPU Upgrade State:           Upgrade Capable
Cryptography Support:        Enabled
Last ME reset reason:        Power up
Local FWUpdate:              Enabled
BIOS and GbE Config Lock:    Enabled
Host Read Access to ME:      Enabled
Host Write Access to ME:     Enabled
SPI Flash ID #1:             EF4017
SPI Flash ID VSCC #1:        20052005
BIOS boot State:             Post Boot
OEM Id:                      00000000-0000-0000-0000-000000000000
```

As in the above example if there are NO errors shown, then

- your platform's health is good
- Intel® ME FW has successfully initialized
- Intel® ME FW is operating normally

Note: This section is only intended to show how to use the MEInfo.exe tool for checking firmware status. For full usage and capabilities of the MEInfo.exe tool, please see the System Tools User Guide.

3.4 Common Bring Up Issues and Troubleshooting Table

Table 3-2. Common Bring Up Issues and Troubleshooting Table

Problem / Issue	Solution / Workaround
System does not boot to DOS	By default, the system will boot to EFI Shell. To boot to DOS, 1. Enter BIOS menu, then go to the 'Boot' screen 2. Change 'Boot Option #1' to be your USB key (ensure USB key is formatted to be DOS bootable) 3. Press 'F4' to save settings and reboot
Hear 3 beeps when platform powers on	Possible device is disconnected or device not found, check <ul style="list-style-type: none"> platform power and CPU fan power connectors DIMM memory modules USB devices (keyboard, mouse, USB key) may be plugged into inactive USB port missing/incorrect jumpers missing CPU or PCH
No display on monitor	Ensure 1.5MB FW SKU supports integrated graphics. Try external graphics card.
USB device not detected or does not work	USB device may be plugged into inactive USB port
System does not boot (Post Code 00)	Incorrect Flash image – possible reasons: <ul style="list-style-type: none"> wrong FW selected during Flash image build process wrong Flash size selected Re-build image with correct settings and re-flash using Flash burner.

§ §

4 Intel® ME Firmware Features - Details and Settings

4.1 Features Supported

These options control the availability/visibility of firmware features.

The ability to change certain options is SKU dependent and some default values will be grayed out and will not be changeable depending on the SKU selected.

All parameters in this section are color-coded as per the key below.

The parameter can be changed
The parameter is read only and cannot be changed

Table 4-1. Feature Default Settings by Intel® 8 Series Chipset Family SKU (Desktop)
(Sheet 1 of 2)

9 Series	Feature	Default Value
Intel® H87 - Desktop	Enable Intel® Standard Manageability; Disable Intel® AMT	Yes
	Managability Application Permanently Disabled?	No
	PAVP Permanently Disabled?	No
	TLS Permanently Disabled?	No
	Intel® Anti-Theft Technology Permanently Disabled?	No
	Intel® ME Network Services Permanently Disabled?	No
	mDNS Proxy Permanently Disabled?	Yes
	Intel® Manageability Application Enable / Disable	Enabled
Intel® Z87 - Desktop	Enable Intel® Standard Manageability; Disable Intel® AMT	Yes
	Managability Application Permanently Disabled?	Yes
	PAVP Permanently Disabled?	No
	TLS Permanently Disabled?	Yes
	Intel® Anti-Theft Technology Permanently Disabled?	No
	Intel® ME Network Services Permanently Disabled?	No
	mDNS Proxy Permanently Disabled?	Yes
	Intel® Manageability Application Enable / Disable	Disabled

Table 4-1. Feature Default Settings by Intel® 8 Series Chipset Family SKU (Desktop)
(Sheet 2 of 2)

9 Series	Feature	Default Value
Intel® Z85 - Desktop	Enable Intel® Standard Manageability; Disable Intel® AMT	Yes
	Managability Application Permanently Disabled?	Yes
	PAVP Permanently Disabled?	No
	TLS Permanently Disabled?	Yes
	Intel® Anti-Theft Technology Permanently Disabled?	No
	Intel® ME Network Services Permanently Disabled?	No
	mDNS Proxy Permanently Disabled?	Yes
	Intel® Manageability Application Enable / Disable	Disabled
Intel® H81 - Desktop	Enable Intel® Standard Manageability; Disable Intel® AMT	Yes
	Managability Application Permanently Disabled?	Yes
	PAVP Permanently Disabled?	No
	TLS Permanently Disabled?	Yes
	Intel® Anti-Theft Technology Permanently Disabled?	No
	Intel® ME Network Services Permanently Disabled?	No
	mDNS Proxy Permanently Disabled?	Yes
	Intel® Manageability Application Enable / Disable	Disabled

All parameters in this section are color-coded as per the key below.

The parameter can be changed
The parameter is read only and cannot be changed

Table 4-2. Feature Default Settings by Intel® 8 Series Chipset Family SKU (Mobile)

9 Series	Feature	Default Value
Mobile Intel® HM87 Express Chipset	Enable Intel® Standard Manageability; Disable Intel® AMT	Yes
	Managability Application Permanently Disabled?	No
	PAVP Permanently Disabled?	No
	TLS Permanently Disabled?	No
	Intel® Anti-Theft Technology Permanently Disabled?	No
	Intel® ME Network Services Permanently Disabled?	No
	mDNS Proxy Permanently Disabled?	Yes
	Intel® Manageability Application Enable / Disable	Enabled
Mobile Intel® HM86 Express Chipset	Enable Intel® Standard Manageability; Disable Intel® AMT	Yes
	Managability Application Permanently Disabled?	No
	PAVP Permanently Disabled?	No
	TLS Permanently Disabled?	No
	Intel® Anti-Theft Technology Permanently Disabled?	No
	Intel® ME Network Services Permanently Disabled?	No
	mDNS Proxy Permanently Disabled?	Yes
	Intel® Manageability Application Enable / Disable	Enabled

4.2 Deep Sx Settings

This chapter covers configuration settings for the Intel® 8 Series Chipset Family based Desktop and Mobile CRB platforms Deep Sx operation.

Table 4-3. Deep Sx Settings for Desktop CRB

Desktop boards without F18 rework	Option	Settings
DeepSx Disabled		
FITC Strap 10	DeepSx	False
BIOS	Advanced -> PCH-IO Configuration-> DeepSx Power Policies	Disabled
Desktop boards with F18 rework	Option	Settings
DeepSx Enabled		
FITC Strap 10	DeepSx	True
BIOS	Advanced -> PCH-IO Configuration-> DeepSx Power Policies	Enabled in S5 or Enabled in S4-S5
DeepSx Disabled		
FITC Strap 10	DeepSx	True
BIOS	Advanced -> PCH-IO Configuration-> DeepSx Power Policies	Disabled

Table 4-4. Deep Sx Settings for Mobile CRB

Mobile boards without DSX rework	Option	Settings
DeepSx Disabled		
FITC Strap 10	DeepSx	False
BIOS	Advanced -> PCH-IO Configuration-> DeepSx Power Policies	Disabled
Mobile boards with DSX rework and KSC >= 1.02	Option	Settings
DeepSx Enabled		
FITC Strap 10	DeepSx	True
BIOS	Advanced -> PCH-IO Configuration-> DeepSx Power Policies	Enabled in S5/Battery or Enabled in S4-S5/Battery
DeepSx Disabled		
FITC Strap 10	DeepSx	True
BIOS	Advanced -> PCH-IO Configuration-> DeepSx Power Policies	Disabled

Mobile Notes:

1. The EC will default to legacy SUS_PWR_DN_ACK mode when you disable DeepSx in BIOS.
2. DeepSx will not work with ATX power supply so you must disable DeepSx in both the strap and BIOS if you want to use ATX.

Behavior on Mobile CRB Boards

1. DSW LED will turn on when SLP_SUS# is asserted
 - a. When entering DeepSx
 - b. When EC powers down SUS due to SUS_PWR_DN_ACK
 - c. SLP_SUS# goes low due to RSMRST# assertion, even if SLP_SUS# is not connected
2. The LED is labeled as "DSW", located next to the ATX power socket.

Behavior on Desktop CRB Boards

1. If DeepSx is enabled, SLP_SUS_N LED will turn off.
2. The LED is located right next to the PostCode Display, with Orange light, labeled as "SLP_SUS_N" CR47EV.

§ §

A Appendix — Flash Configurations

This chapter covers only the basic information needed for clock control parameter programming. For a more detailed treatment of Cougar Point clocks, see Intel® 8 Series Chipset Family *Platform Clocks* and Intel® Management Engine — *Platform Compliance Guide for ME Hardware*.

B Appendix — ICC SKU Support Matrix

Note: Please refer to Intel® 8 Series Chipset Family Platform Controller Hub (PCH) External Design Specification (EDS) for detail about Intel® 8 Series Chipset Family Full Clock Integration Mode Architecture and Intel® ME FW clock control parameters.

For more information on validating and checking compliancy for PCH clocks, see Intel® 8 Series Chipset Family *Intel® Management Engine — Compliancy Guide*.

B.0.1 ICC SKU Support Matrix

The following table describes features, clock range (maximum and minimum), spread mode supported by Intel® 8 Series Chipset Family PCH SKU. The ICC SKU is divided into 3 categories; Basic, enhanced, and Extreme.

Table B-1.

PCH SKU	Basic	Enhanced	Extreme
Q87		X	
Q85		X	
B85		X	
H87		X	
Z87			X
Z85			X
H81		X	
QM87			X
HM87			X
HM86	X		
C222		X	
C224		X	
C226		X	
Features Supported	Display Clock Bending	Display Clock Bending Adaptive Clocking (Wimax Friendly Clocking)	Display Clock Bending Adaptive Clocking (Wimax Friendly Clocking) CPU BCLK Overclocking

Table B-1.

PCH SKU	Basic	Enhanced	Extreme
Pre-Defined ICC profile supported.	Standard	Standard WiMax 3G	Standard WiMax 3G Overclocking
Clock Range Supported	1. MODDIV2 will be turned off. 2. MODDIV3 * [Min-Max]=100MHz.	1. MODDIV2 [Min - Max] = 98.4055 - 100 MHz. 2. MODDIV3 * [Min - Max] = 99.5392-100 MHz .	1. MODIV2 [Min - Max] = 99.5463-800 MHz 2. MODDIV3 * [Min - Max] = 99.5392-100 MHz .
Spread Mode and Max Spread % Supported	Lynx Point PCH HW supports Down Spread mode with Max Spread % = 0.5%		

Min = Clock Div Max (minimum allowed frequency)

Max = Clock Div Min (maximum allowed frequency)

* MODDIV3 range limits are specified based on PCIe specifications.
